Sprint 4

This is a team assignment, your group can (and should) divide up the work. Please read this whole document carefully before getting to work.

As usual, the sprint lead for Sprint 3 needs to send an assessment email to each member of their team awarding the 0-N tokens that are proportional to their performance during Sprint 3. The email has to contain feedback on their performance (what they did well, what they need to improvement and any other feedback you see fit). Don't hesitate to include your instructor on the email.

In Trello: Sprint 4 Board

1. Sprint planning
2. Tracking progress

Develop!

- Functional completeness, your goal is to deploy a release candidate version!
 - This means you finalize any incomplete features
 - Document any known bugs/issues
 - Create a set of story acceptance tests focusing on the UI
 - Test each of these on 3 desktop web browsers, and one mobile browser • Document problems
 - Add performance testing code and report the time it takes to completely display your main page (your primary data visualization page).
 - Create a deployment build • Write a script to deploy (install) your software.
 - Monetization: Does your app have a source of revenue?
 - You should add ads or have a subscription link setup (or other appropriate feature)
- Test functions for each feature.
- Graceful error handling (i.e. mismatched tags shouldn't break your beautiful display)
- Continued focus on your team's project goals (Security, Aesthetics, Performance, etc.)

README

- Timing numbers (before Sprint 5 & final)
- Web browser compatibility & known issues
- Final testing coverage, include an estimate of your story acceptance tests—how much do they increase the computed %?
- Quality Attributes Discussion
- Security
- Bug fixes as reported at the end of Sprint 4

Reflect (Review & Retrospective)

Before the last Thursday of the sprint you should reflect:

- What went well during the sprint cycle?
- What went wrong during the sprint cycle?
- What could we do differently to improve?

In class we will review, which may include code review, demos, and comments on the reflections.

As part of your reflection, you may want to take a moment to email the instructor with any comments you have so far regarding this sprint or the class as a whole.

Submission

The “submission” of your code will be the most recent version of your software (on Github) prior the start of class on the last day of the sprint. Your instructor will check to see that Travis-CI is in a successful build state, your code may be cloned by your instructor and tested for the functionality requested. It is highly recommended that you include a summary of completed features (and if necessary how to use them), in your top level README file.

GitHub

- All bugs should be fixed and issues closed on github
- All branches should be merged into the main
- All branches (other main) closed and deleted
- All code commented and uniformly formatted
- All unused code removed from the repo
- All password files/information and sensitive information redacted from repo

Grading

Multiple git pushes by all team members.

Minimum requested features implemented including test functions

Additional features implemented as time permitted including test functions

Correct and complete use of Trello

CI on pull requests & code coverage integration is active

Rubric

Features (& tools setup) as specified in sprint 35%

Additional features as defined by team. 25%

Git commits, Trello use 25%

Complete Testing and Coverage 15%

Teamwork is scored for the whole project. Each sprint’s grade may be modified for absences, failure to meet your team at agreed times, responding to emails late, or delivering code late, among other possible issues
